

NEURONS AND CHEMICALS ARE BITS (ANATOMY), IT IS MIND (PHYSIOLOGY) - (CCP, CODE PCPS AND CP) BEHIND SENSE OF LOVE AND ORGASM IN MAN AND WOMAN.

Dr V M Das

Das Nursing Home, Fatehgarh, India

Abstract: Adolescents hold the future of every nation and it is vital to ensure that they are socially integrated beings. The complexity of adolescence however may prove to be a stumbling block in ensuring that they grow to be holistically well individuals. The aim of the paper is to discuss a model of holistic and multidisciplinary promotion of the mental health of adolescents in a specific township in Swaziland. The model came up as a result of a study aimed at developing a model for psychiatric nurses to assist families, adolescents and organization including teachers to reintegrate mentally disintegrated adolescents into the family and community and to develop strategies for implementation and evaluation of the model following an observation made by families in a previous study in which adolescents were found to lack a supportive environment. A model with its strategies was developed and as per this article a three steps process in model development was discussed. In conclusion, it was recommended that the model strategies be used to promote mental health of adolescents in and out of school in the specific township or in the country, Swaziland at large.

Key words: Divine mechanics, Mind and Mass, Atomicgenetics, Basic Building blocks.

Introduction: Atomic genetics is the branch of science where we investigate about fundamental interactions of the universe i.e. atomic transcription and translations. New words have been coined to understand hidden science of mind part of reality. Mind reality has been

recognized as different faces by “I” about 5000 years back to Arjuna in Mahabharata. (Fig 1) It is just like to understand any language through Alphabets. These are (different faces) Alphabets of mind reality. One Mind reality has one face identity and the second mind reality has second face identity and so on. The facial expression represents phenomenon of intelligence and different faces represent different types of properties carrying property. The open eyes means property is activated while close eye means property is inactivated. In spite of carrying properties conscious ness they also

Accepted after revision: July 2015

Downloaded from: www.johronline.com

know how to conduct not only origin of universe but also how to create two different universes i.e. next creation could be different from this creation. In all, it is automatic system of the universe. The mind realities which are of good properties have devtas face identity (first five faces on both sides) and those mind realities which are of bad properties have demons face identity (last four faces on both sides). These are named as code PCPs or messenger atomic genes. The central face is CCP or Thought script where all thoughts of the

universe are banked. It is bank of data of all information s of the universe It is face identity of Anti mind particles as data of all information's of the universe are stored as anti mind particles . It is the Time mind ness (biological clock) that keeps on expressing different thoughts from this thought script (CCP). There are four more faces (black bodies) shown on extreme left and right floating in fire is CPs (translating Atomic genes). That translates the messages and realizes it and reacts accordingly.

Prayer message formation in brain. (Fig 4)

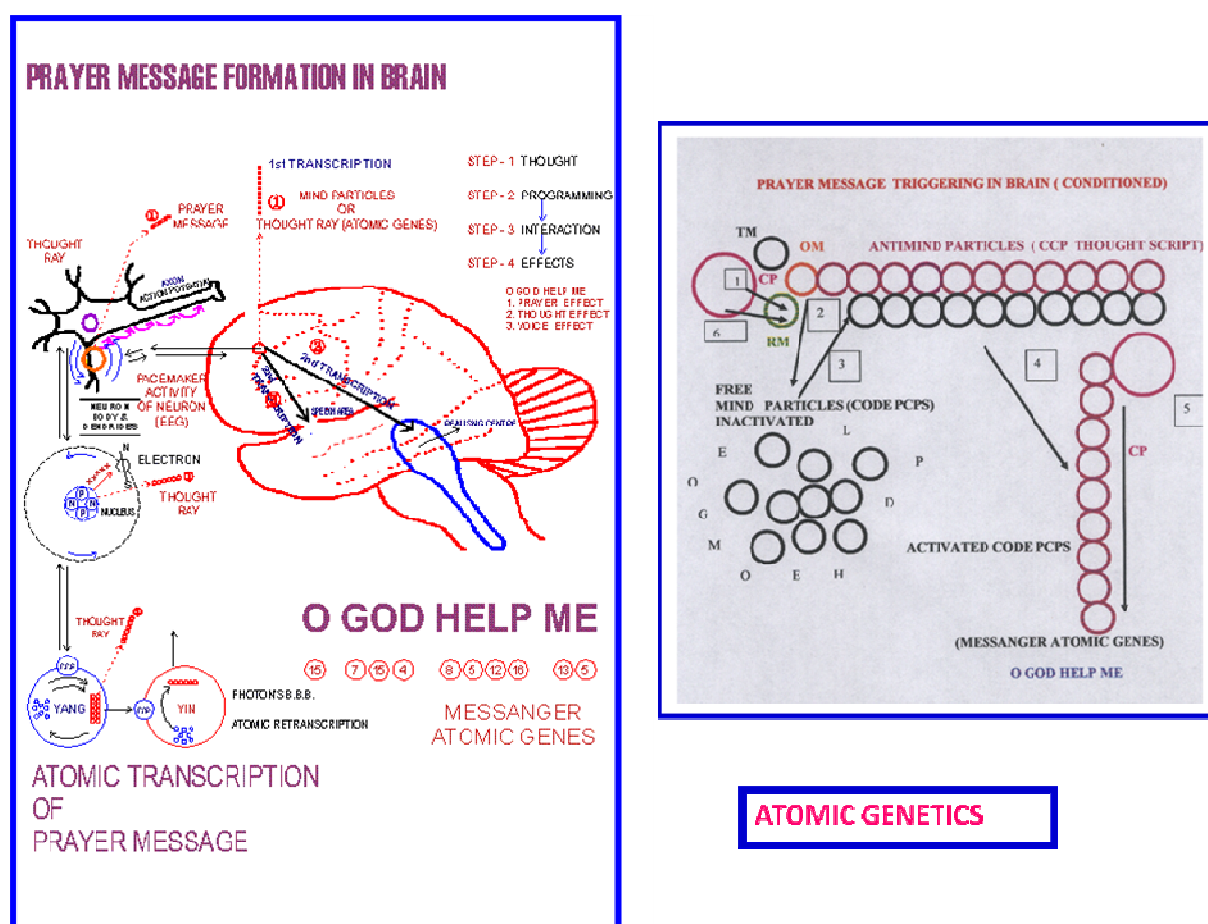

Fig 4 Prayer message formation in brain

In atomic transcription and translation of prayer, following steps take place on Yang B.B.B – B-Bit (Figure 4).

1. CP removes RM (repressor mindness-green) from OM (operating mindness -orange) thus induction of atomic transcription triggers.
2. OM triggers activation of free mind particles (black **-inactivated code PCPs**) of that thought script (magenta) of “**o gods help me**”.
3. Free mind particles (black **-inactivated code PCPs**) get attached to anti mind particles script (magenta one) to form messenger thought script of “**o god help me**”.
4. Messenger atomic genes (black) get activated by anti mind particles thought script and further they get detached from anti mind particles thought script to form activated messenger atomic genes (activated code PCPs) (magenta) of “ o god help me ”
5. CP carries phenomenon of splicing by translating the messenger activated atomic genes (activated code PcPs) and finally there is activated message of “o god help me” is formed.
6. CP represses atomic transcription by adding RM (green) to OM (orange). Thus atomic transcription gets **halt**.

Having formed the message it comes out in three forms.

In atomic genetic engineering (prayer) we use our basic power i.e. power of B.B.Bs. Our B.B.B. (higher center) talks with highest center of the universe by sending the message by first transcription. Till today nobody knows how the brain generates thoughts. I am going to tell you that mystery too. In the frontal lobe the neurons are responsible for thought generation. In the neuron there is electrical activity called pacemaker activity which is occurring between dendrites and the body of the neuron. The membrane of the cell is made up of atoms and atom is made up of B.B.Bs. At the level of B.B.B. say thought of '**O GOD HELP ME**' is expressed. As a result programmed messages of O GOD HELP ME (code PCPs) are formed. Out of three programmed messages, one is

carried by atomic genes to highest center of the universe. It is called **THOUGHT RAY (Quantum entanglement)** which is made up of pure atomic genes and then the message goes through phenomenon called first transcription. They come out from brain directly. The other two messages are carried by photons from nucleus of atom to electrons. Here they are modulated on electrical activity of the cell called pacemaker activity. Further they are modulated on actions potentials going towards **REALIZING CENTER** situated in brain stem (RAS) and from RAS to speech area situated in the frontal area. Target B.B.Bs. of the realizing center finally realizes thought effect of O GOD HELP ME. While from speech area message goes to motor cortex again via RAS and from there to vocal cords and finally it comes out as a speech effect of O GOD HELP ME. In layman's terminology formation of the thought ray means PRAYER. (Fig 4)

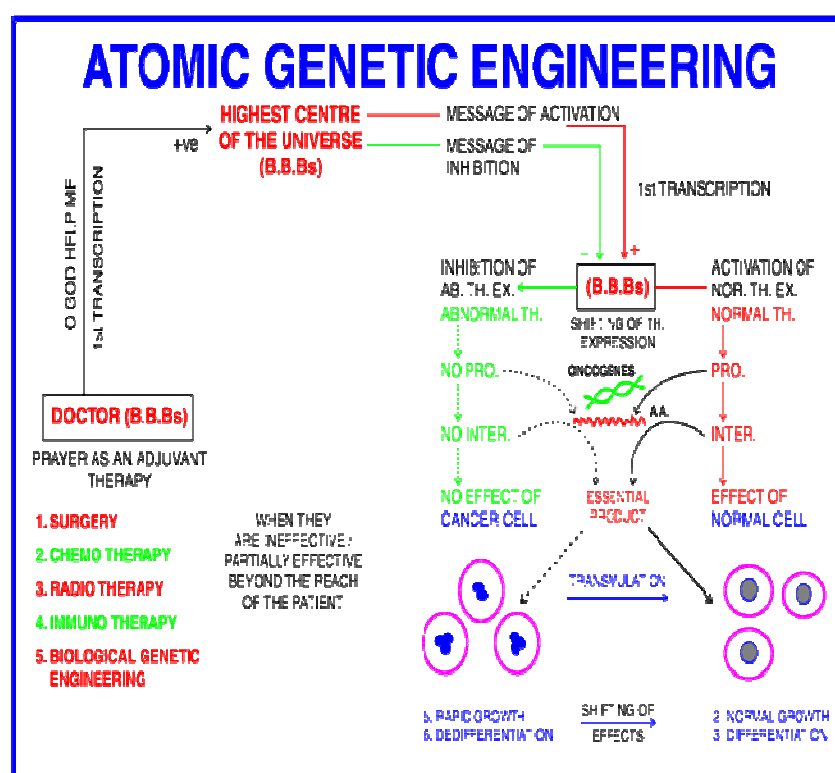

Where Does Prayer Message go? (Fig -8)

Prayer message goes (Figure 8) to highest center of the universe via first transcription where it is realized and it is accepted, the highest center sends two messages to B.B.Bs working as higher center in cancer cell. These messages are message of inhibition of abnormal thought expression and message of activation of normal thought expression. Having received the messages, higher center stops expressing the abnormal thoughts and it starts expressing the normal thoughts. As a result, there are no more abnormal programmed messages and in place of that normal programmed messages are there. Now the messages have shifted from abnormal (5 and 6) to normal (2 and 3). This shifting of thought expression is called **ATOMIC GENETIC ENGINEERING (figure -4.1)**

The changed messages reach to target B.B.Bs. through same route. Having received the changed messages, target B.B.Bs. stop expressing the previous programming and they start expressing the normal programming. As a

result the cancer cells transmutate into normal

cells. Or diseased cell gets cured. (Fig -4.1)

FINAL STAMP OF SUCCESS TO THE THEORY

A Randomized, Controlled Trial of the Effects of Remote, Intercessory Prayer on Outcomes in Patients Admitted to the Coronary Care Unit

Context: Intercessory prayer (praying for others) has been a common response to sickness for millennia, but it has received little scientific attention. The positive findings of a previous controlled trial of intercessory prayer have yet to be replicated.

Objective: To determine whether remote, intercessory prayer for hospitalized, cardiac patients will reduce overall adverse events and length of stay.

Design: Randomized, controlled, double-blind, prospective, parallel-group trial.

Setting: Private, university-associated hospital.

Patients: Nine hundred ninety consecutive patients who were newly admitted to the coronary care unit (CCU).

Intervention: At the time of admission, patients were randomized to receive remote, intercessory prayer (prayer group) or not (usual care group). The first names of patients in the prayer group were given to a team of outside intercessors who prayed for them daily for 4 weeks. Patients were unaware that they were being prayed for, and the intercessors did not know and never met the patients.

Main Results: Messages: The medical course from CCU admission to hospital discharge was summarized in a CCU course score derived from blinded, retrospective chart review.

Results: Compared with the usual care group (n=524), the prayer group (n=465) had lower mean SEM weighted (8.350.26 vs 7.130.27; P=.04) and unweighted (2.70.1 vs 3.00.1; P=.04) CCU course scores. Length of CCU and hospital stays were not different.

Conclusions Remote.

Intercessory prayer was associated with lower CCU course scores. This result suggests that prayer may be an effective adjunct to standard medical care.

4.1 - A.G.E and Final stamp of success to New Theory

Message system of the Universe

Before the origin of the universe nature had only one type of message systems which is called **FIRST TRANSCRIPTION**. Messages (Code PcPs) used to go from one B.B.B. to another B.B.B. by atomic transcription. Messages were carried by atomic genes (Code PcPs) with very very high velocity. It is the fundamental message system.

After the origin of the universe, nature created atoms. It also created one more message system called **SECOND TRANSCRIPTION**. Here the messages (code PcPs) are carried by photons from one atom to another atom with velocity of light. Thus atoms, molecules, cells, and even individuals talk with one another

After the formation of the cell, nature created one more system called **THIRD TRANSCRIPTION**. Here there is a message storage system formed by DNA. There are messenger molecules called mRNA that carry message from DNA script to cytoplasm where the message (code PCPs) is read or translated by ribosome and they work accordingly. Thus the messages reach to enzymes and hormones and finally messages reach to target units. Having received the messages, target units work accordingly. Finally life effects (metabolic) are observed. These three types of message systems are working in the nature. These message systems are being used by the nature according to nature's need. (Fig-5)

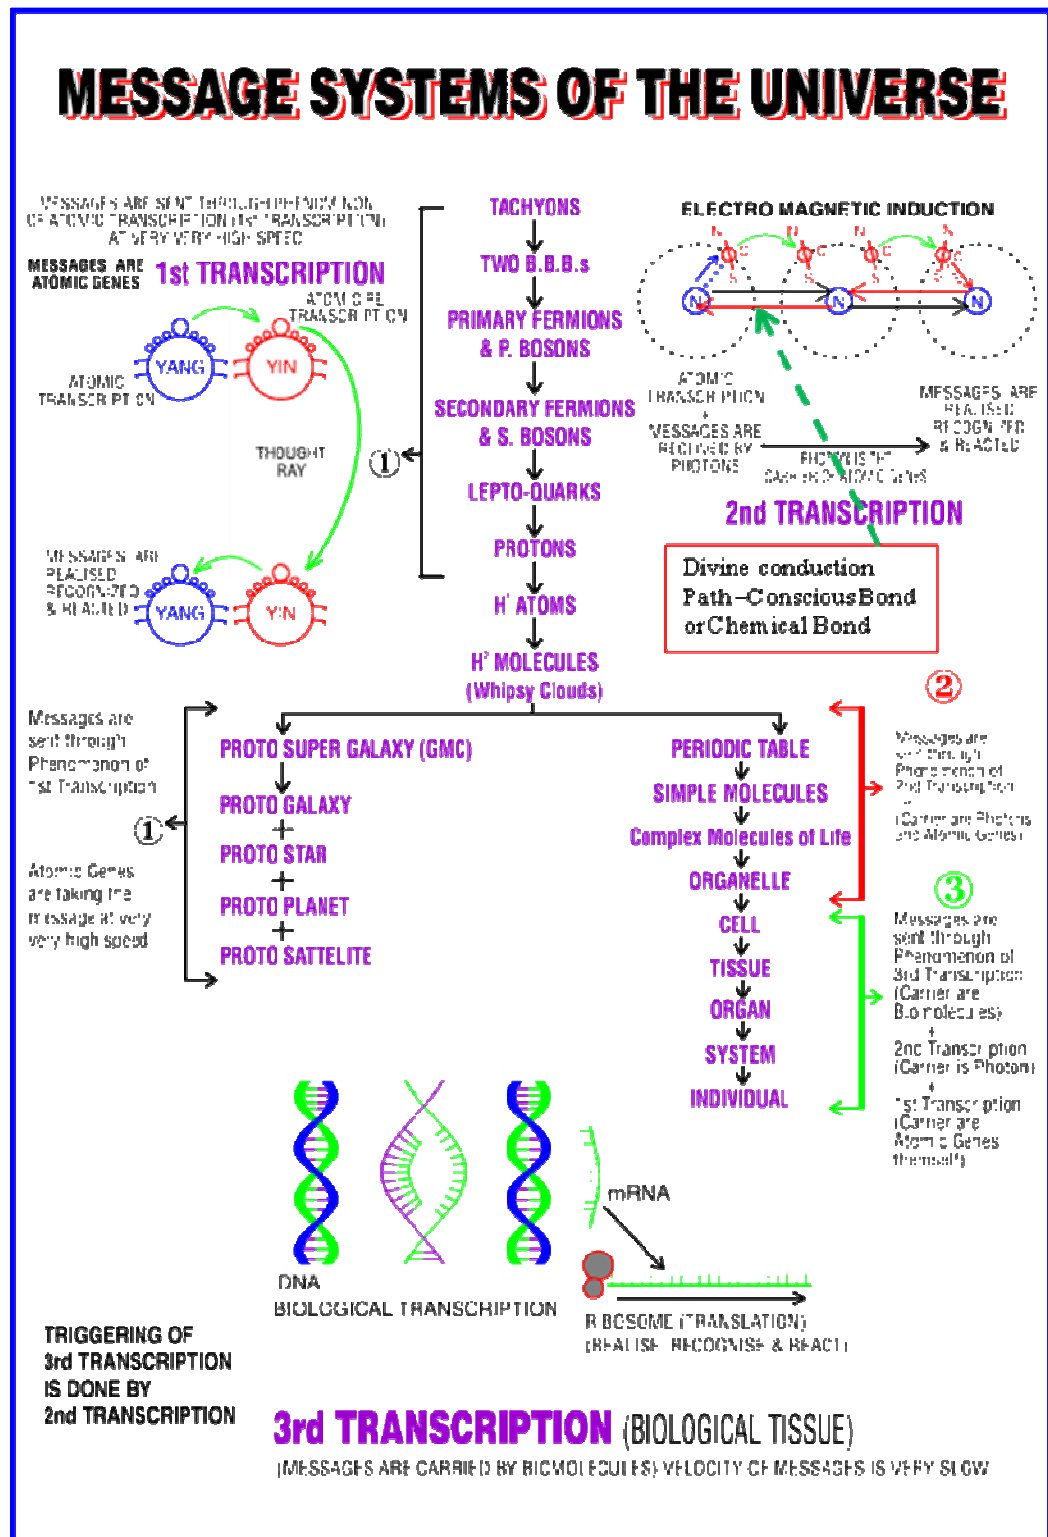

Fig -5

How does nature work & triggering of normal & abnormal effects (Fig-6 and 7)

To understand creation physics we have to see Fig- 6 and Fig -7. . There are two types of thought stimulation. One is **CONDITIONED Thought Stimulation** and other one is **Unconditioned Thought Stimulation**.

STIMULATION OF THOUGHT EXPRESSION --- There are two types of thought expressions one is **CONDITIONED STIMULATION** of thought expression, and other one is self stimulation of thoughts i.e. **UNCONDITIONED STIMULATION** of thought expression.

At the time of the origin of the universe, all effects got created. The cause of all effects of the universe is **THOUGHT** expression. These thought expressions were triggered by **UNCONDITIONED OR SELF STIMULATED WAY**. It is the first step and it is followed by **PROGRAMMING** or formation of programmed messages by code PCPs. This programmed message moves from higher centers to target B.B.Bs. it is called **INTERACTION**. Having received the messages, the mind and mass of the target B.B.Bs. work in a synchronized way so as to produced the effects as thought by a the higher center. If the thought expression by higher center is normal, the shapes, properties and laws produced by target B.B.Bs. would be normal and if the thought expressions are

abnormal, the shapes, properties and laws would be abnormal. This is the basic concept of transmutation phenomenon. Finally what we observe is called **EFFECT**. Appearance of new shapes. Properties and laws are called **TRANSMUTATION**. The first three steps are collectively called **CCP**. During transmutation process if **CCP** is written, it does mean that unless the thought, programming and interaction take place, nature cannot transmute. Transmutation phenomenon is seen in particles, atoms, molecules and even in cells. The basic steps of any transmutation remain the same except that the thought expressions differ.

The subatomic particles are made up of more fundamental particles called Basic Building Blocks (B.B.Bs) which are made up of mind and mass. These B.B.Bs are divine in nature with the result they talk with each other by phenomenon called atomic transcription and translation (thought expressions). The triggering of broken symmetry is caused by atomic transcriptions. Unless the atomic transcriptions occur, subatomic particles could never exhibit phenomenon of broken symmetry. So the broken symmetry is never spontaneous. It is being mis-understood that sub atomic particles do have spontaneous activities as far as broken symmetry is concerned. Hence the Nobel prize physics 2008 awarded to this work is too early to give prize.

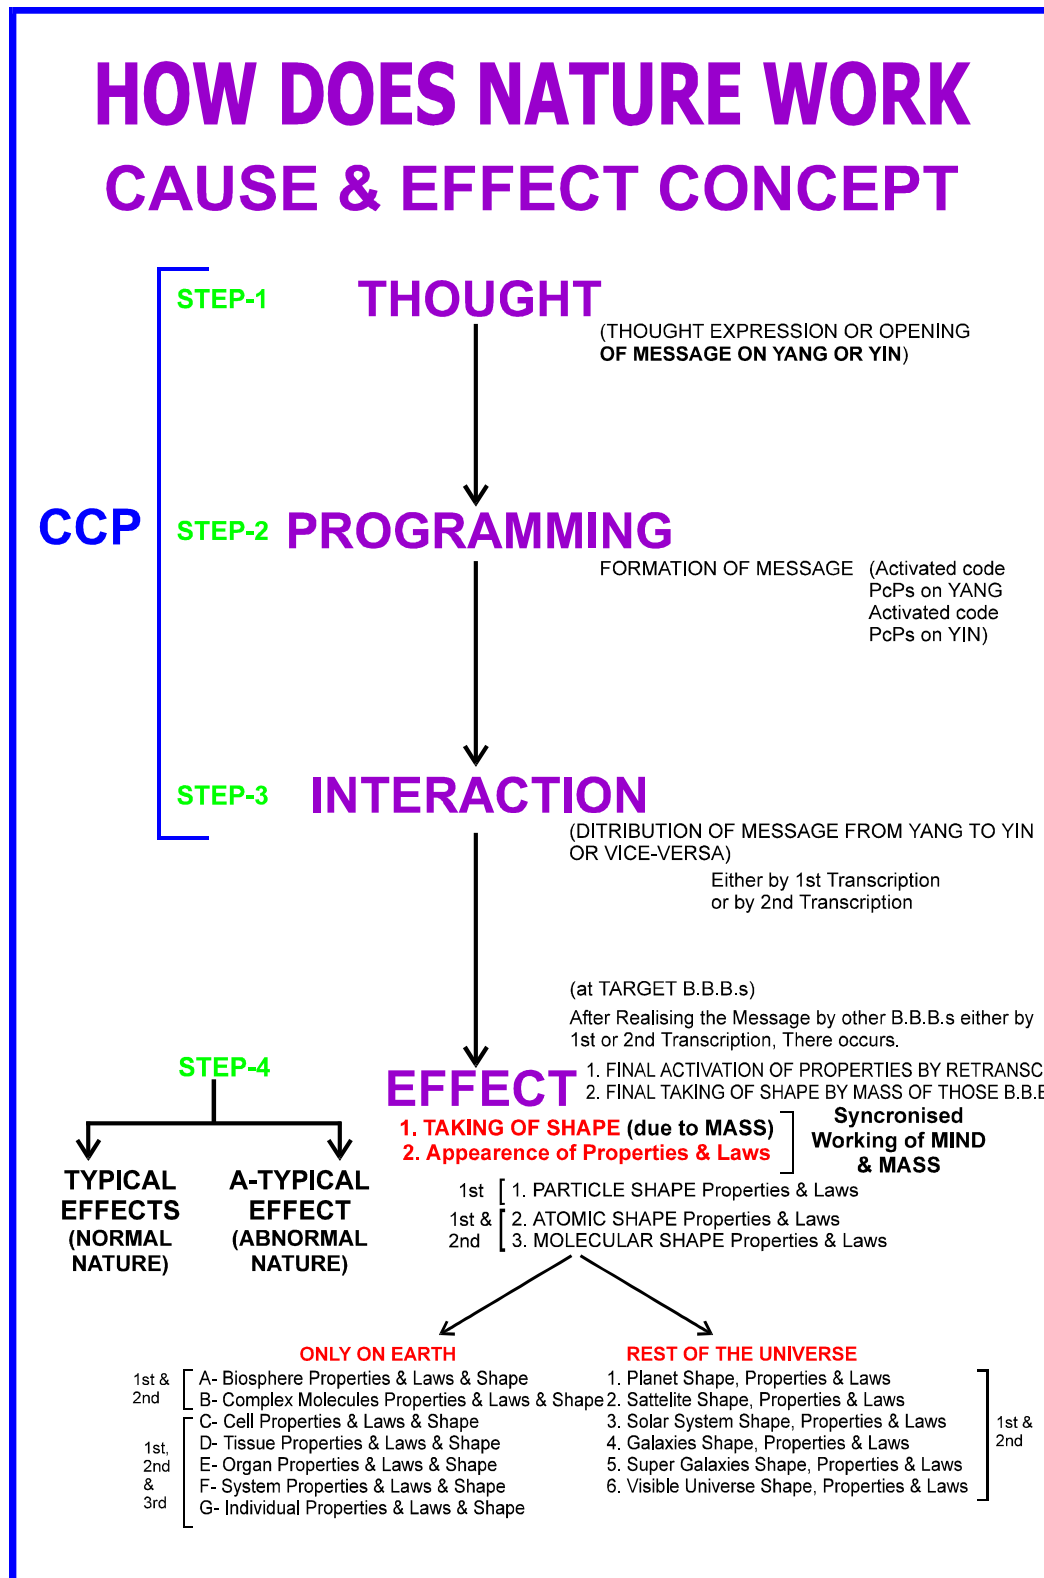

Fig 6

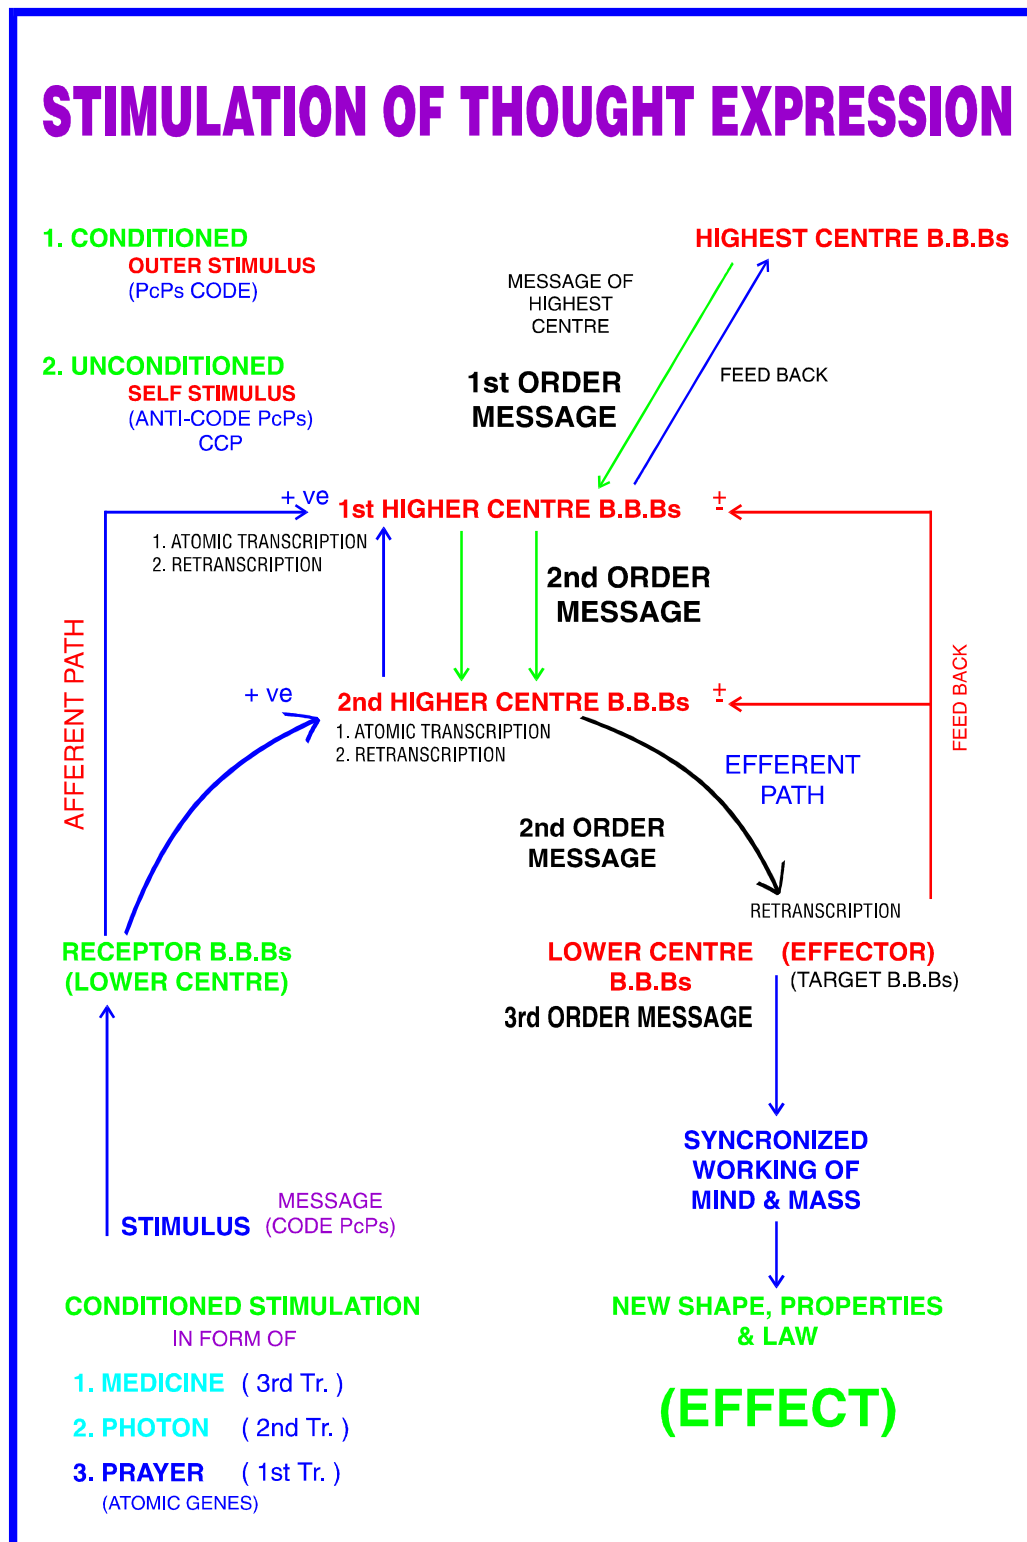

Fig 7

Message network of the Universe (Feed Back Mechanism and different centers of the Universe)

With the origin of universe, nature first created primary units i.e. primary fermions (gravitation) and primary boson, these primary units are equipped with one higher center (one B.B.B.) and rest of the B.B.Bs. are working as lower centers or target B.B.Bs. After primary units ,nature created secondary units i.e. secondary fermions and secondary bosons. similarly nature created tertiary units (lepto-quarks) and then quaternary units (protons& neutrons).

Each unit is equipped with higher centers, lower centers and target B.B.Bs. After quaternary units nature created atomic units, molecular units, complex molecules of life units, organelle units, cell units, tissue units, organ units, system units and individual units. Each unit is equipped with higher centers, lower centers, and target B.B.Bs. Similarly nature created satellite units, planet units, solar system units, galaxy units, super galaxy units, dark matter layer unit. These units are also

equipped with higher centers, lower centers and target B.B.Bs. Thus our universe is divided into different units and each unit is equipped with higher and lower centers. All higher centers are under control of highest center of the universe by efferent paths. This efferent path is made up of first transcription. Higher centers can send messages to highest center of the universe by afferent path or feed back path. Thus highest center of the universe is well informed about all effects of the universe. Messages can come from lower centers to higher centers and from higher centers to highest center of the universe via afferent path. The highest center of the universe can send messages to higher centers and from higher center to lower centers. There is an inter unit message network also which is made up of first, second and third transcription depending upon the nature's need. Thus the entire universe is under control of highest center of the universe. Highest center can change any programming programmed by it during pre creation era. **See (Figure.8)**

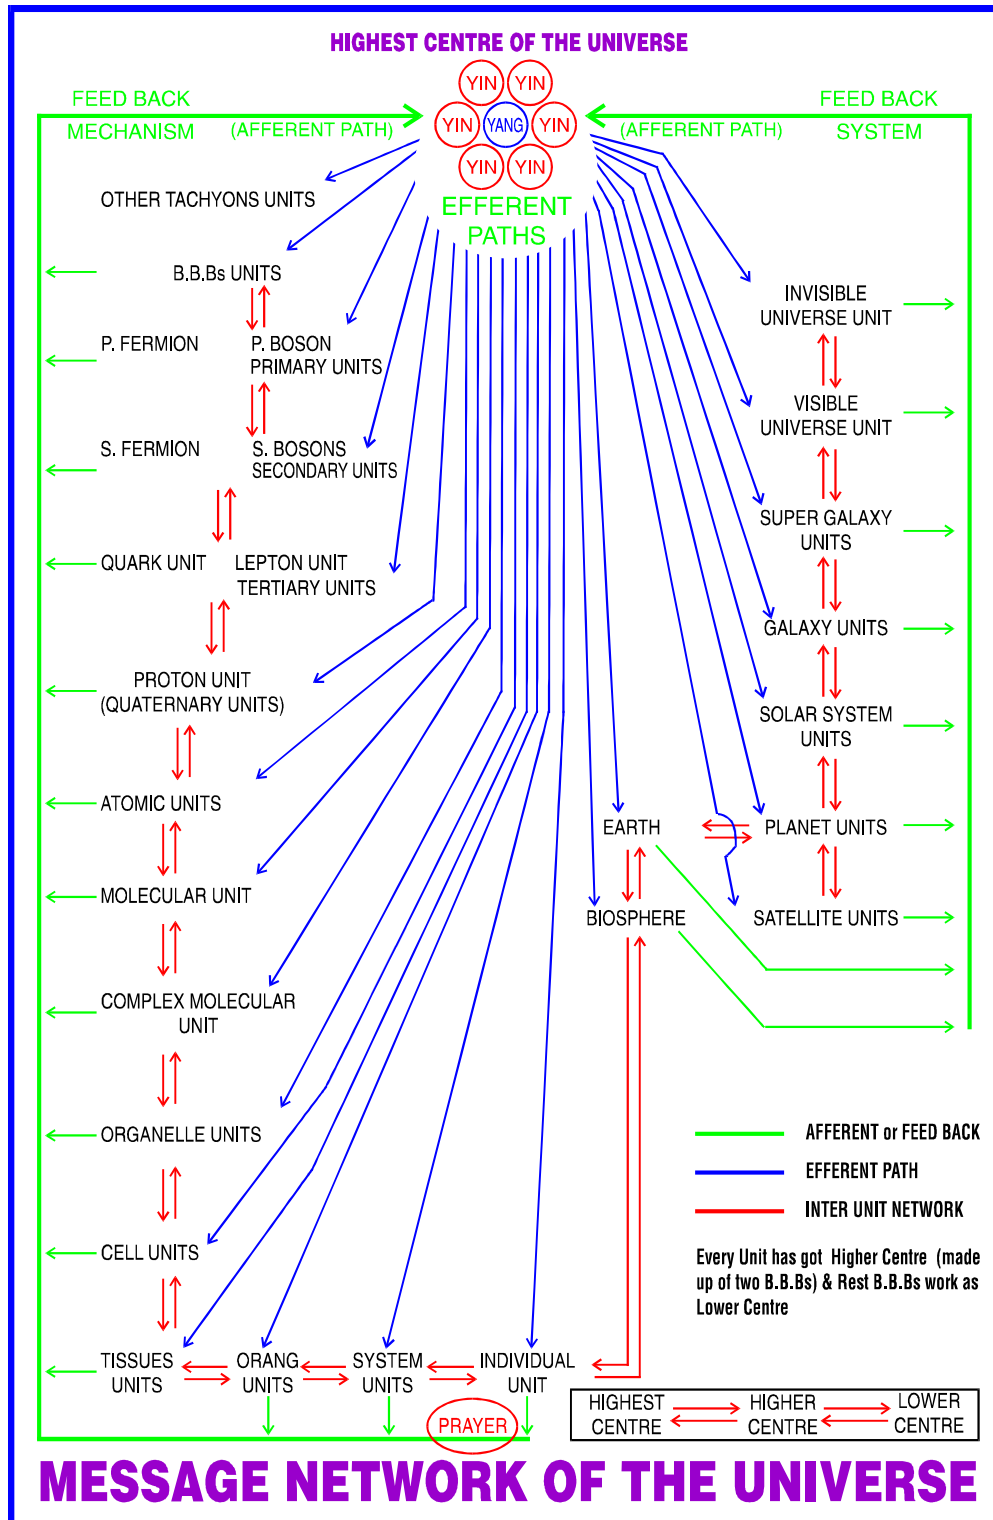

Fig- 8

Structure - Brain nucleus involved in sense of love is Caudate Nuclei for commitment and permanence (Fig -9). Nucleus Accumbens and VTA for computation of sensory inputs and finally generation of information s (Code PcPs)

of pleasure of sense of love in NAcc. The frontal lobes is responsible for triggering of psychological phenomenon like attraction and attachment informations (code PcPs) and their realization in RS (reticular system).

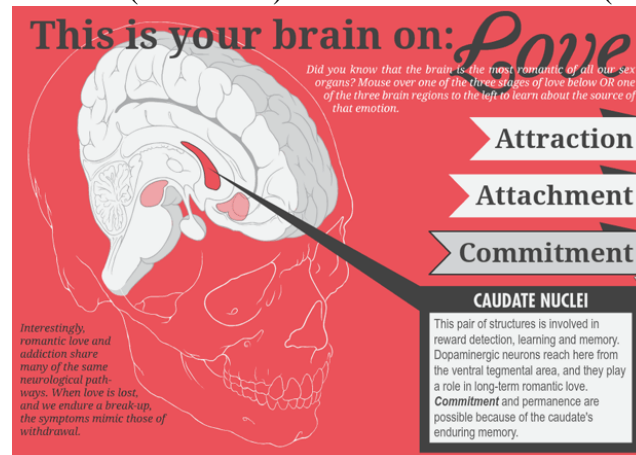

Fig -9 – role of caudate nucleus in brain on love -The illustration on this post is based on Dr. Helen Fisher's work, and shows the areas of the brain involved in romantic love. [26]

How Duchenne smile reduces stress? (Fig 10) [25]: The muscles of face are activated through facial nerve which is the seventh (VII) of twelve paired cranial nerves. It emerges from the brainstem and controls the muscles of facial expression. Cells of the motor nucleus of facial nerve receive inputs from the primary motor cortex in the frontal lobe of the brain. When the primary motor cortex receives impulses from the pleasure centre of the brain the muscles of face involved in the expression of pleasure, which are the muscles of Duchenne smile, become active and a smile is seen on the face.

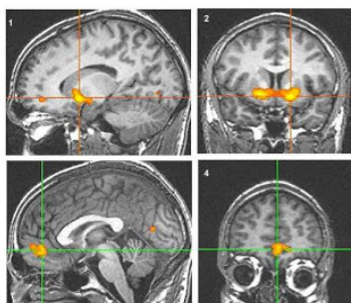

Fig 10-Activated Nucleus Accumbens seen in fMRI scan

Pleasure center is the general term used for the brain regions involved in pleasure. The Nucleus Accumbens, part of the limbic system, plays a role in sexual arousal and the "high" derived from certain recreational drugs. Nucleus accumbens is an important centre involved in the expression of pleasure.

The causes of stress and the body's response to stress are a well known and researched subject. The expression of stress on the face is achieved by tightening of muscles of smile. The Nucleus Accumbens plays a key role in initiating and maintaining stress. When the muscles of face involved in Duchenne smile are activated as if in the expression of pleasure by an artificial smile, impulses are sent back to the Nucleus Accumbens activation of which may reduce stress.

We can discuss sense of love as -

1. Cycle of sense of love

It is cycle of perception which is evoked by thought (unconditioned) or by outer stimuli like eyes (Visual) ear (Auditory) touch (of sex organ etc) (conditioned stimulation) (Fig 11) and by Caudate nucleus (Fig 9)

(Fig 11- Conditioned stimulation of perception phenomenon of love in female)

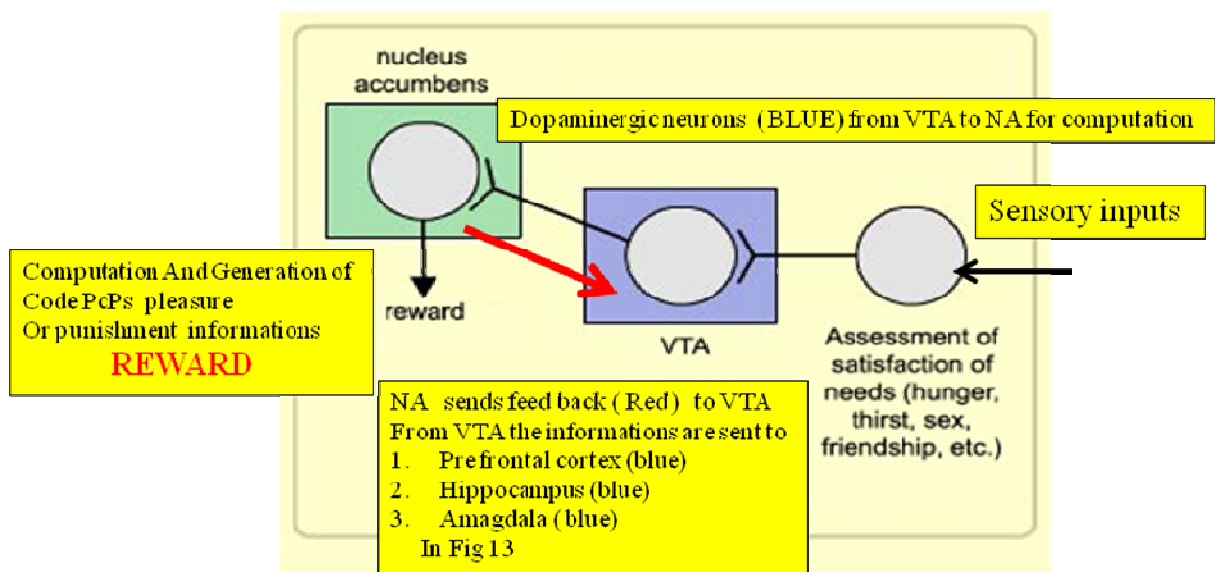

Fig 12 – stimulation of reward circuit and generation of Code PcPs pleasure of sense of Love (Computation) in NAcc – see fig 13

The *ventral tegmental area (VTA)*, a group of neurons at the very centre of the brain, plays an especially important role in this circuit. The VTA receives information from several other regions that tell it how well various fundamental needs, and more specifically human needs, are being satisfied. The VTA then forwards this information to another structure further forward in the brain: the *nucleus accumbens*. To send this information to

the *nucleus accumbens*, the VTA uses a particular chemical messenger: *dopamine*. The increase in the level of *dopamine* in the *nucleus accumbens*, and in other brain regions, reinforces the behaviours by which we satisfy our fundamental needs (Fig -12).[27]
Reward Circuit – pleasure and punishment informations generation in NA (nucleus accumbens)

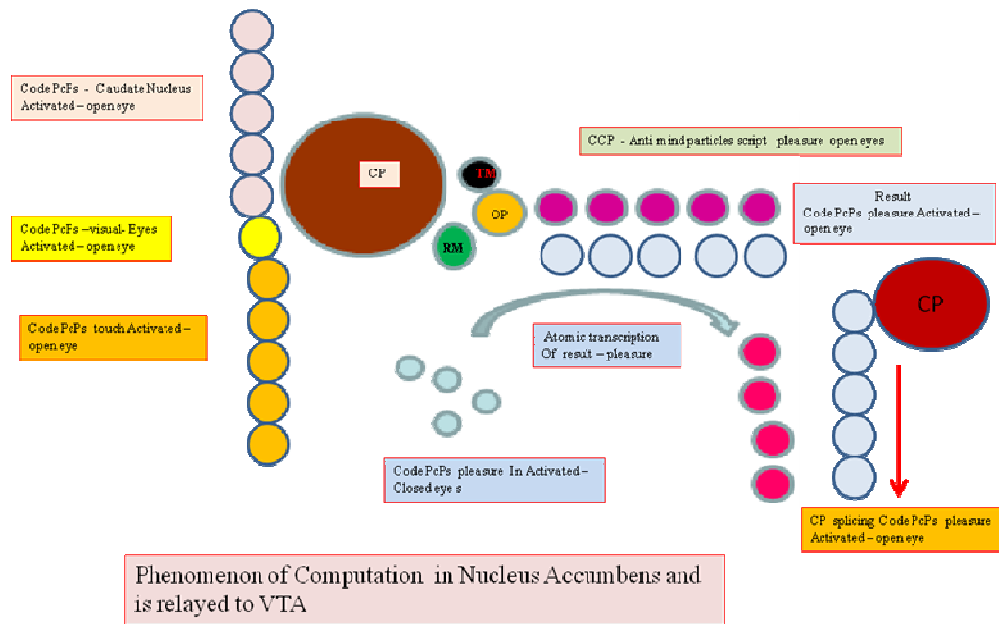

Fig 12.1 – Phenomenon of computation in NAcc of Reward information s generation

In atomic transcription and translation of reward result, following steps take place on Yang B.B.B – B-Bit (Figure 12.1).

1. CP translates three informations of Code PcPs caudate nucleus, Code PcP visual and Code PcPs touch.
2. CP removes RM (repressor mindness-green) from OM (operating mindness -orange) thus induction of atomic transcription of reward (pleasure or Punishment) is triggered .
2. OM triggers activation of free mind particles (blue -**inactivated code PCPs**) of that thought script (magenta) of “**Code PcPs pleasure**”.
3. Free mind particles (blue -**inactivated Code PCPs pleasure**) get attached to anti mind particles script (magenta one) to form messenger thought script of “**Code PcPs pleasure**”.
4. Messenger atomic genes (blue) get activated by anti mind particles thought script and further they get detached from anti mind particles thought script to form activated messenger atomic genes (activated code PCPs) (sky blue – open eye) of “**Code PcPs pleasure**”

5. CP carries phenomenon of splicing by translating the messenger activated atomic genes (activated code PcPs) and finally there is activated message of “**Code PcPs pleasure**” is formed .

6. CP represses atomic transcription by adding RM (green) to OM (orange) . Thus atomic transcription gets **halt**.

These information s (Code PcPs) are carried by photons and chemical (synapses) in brain from one center to other centers.

Having received perception impulses (yellow) the second is the stimulation of reward circuit and generation of information s Code PcPs pleasure or punishment in NA . The message is sent to nucleus accumbens (For computation) from VTA (Blue) and **there is feed back (red) to VTA** . The VTA will send messages to other centers (Blue) like Hippocampus (memory store of informations) , Prefrontal cortex (from pre frontal cortex, information of punishment and pleasure are relayed to RS) , and Amygdala , through dopaminergic axon (Blue neurons) .(fig 12 and Fig 13)

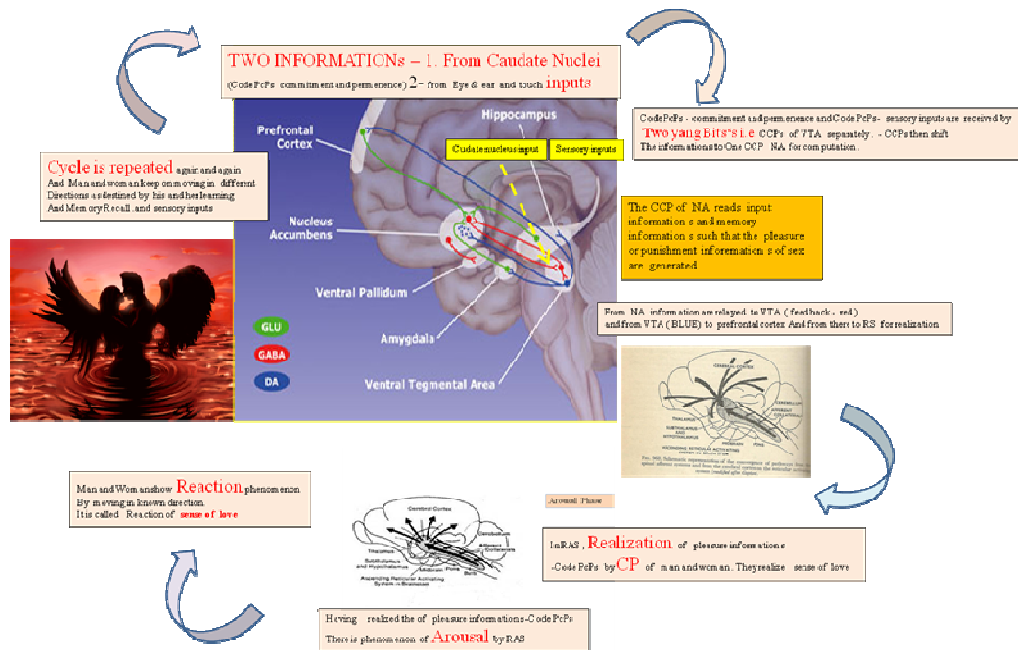

Fig – 13 Reward circuit gets triggered in sense of love to generate information s code PcPs pleasure or punishment

While other parts of the pleasure center, the amygdala and the ventral medial prefrontal cortex, are responsible for harm avoidance, the NAcc is responsible for rewarding. thisisanothercastle.com [24]

There is Feed back to Nucleus Accumbens (Green) from Prefrontal cortex. If the informations of pleasure is there the act of reward will continue and if there is punishment informations, Prefrontal cortex will send it to NA (green) and NA will stop further act of REWARD COMPUTATION. Feed back to NA are also received from hippocampus (Green) and Amagdala (Green). There is feed back (Red) from VTA to NA to continue informations generations or vice versa as decided by partners (thought Sensory inputs). These information s for computation are carried by chemicals specially dopamine (blue) from VTA (messages from caudate

nucleus and in put sensory) to Nucleus accumbens (from synapsis) . These chemical also carry information s of Code PcPs pleasure or punishment via dopamenirgic axon (blue) to prefrontal cortex from VTA. It is then relayed to RAS. In RS realization of information s Code PcPs pleasure or punishment is done by CP. Next is arousal from RAS and messages go for reaction. During reaction the voluntary reaction (motor cortex) as well as involuntary reactions (hypothalamus – autonomic activity- nervi ergentis – parasympathetic – and sympathetic to artery to regulate blood flow to sex organ to continue erection) are triggered . The cycle is repeated till pleasure of sense of love with erection is continued and finally peak of pleasure (Code PcPs peak pleasure generated by NA) is reached and phenomenon of orgasm is triggered. (Fig 14)

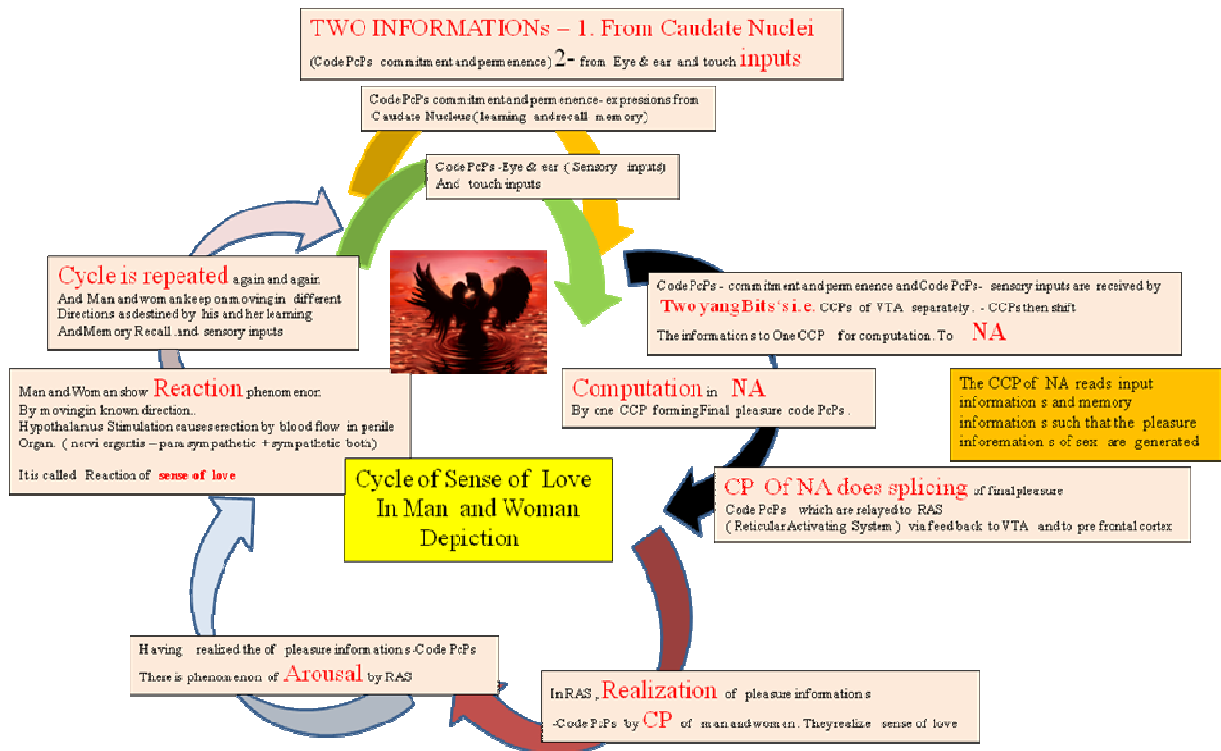

Fig 14 - Cycle of pleasure of sense of Love

2. Cycle of sense of orgasm

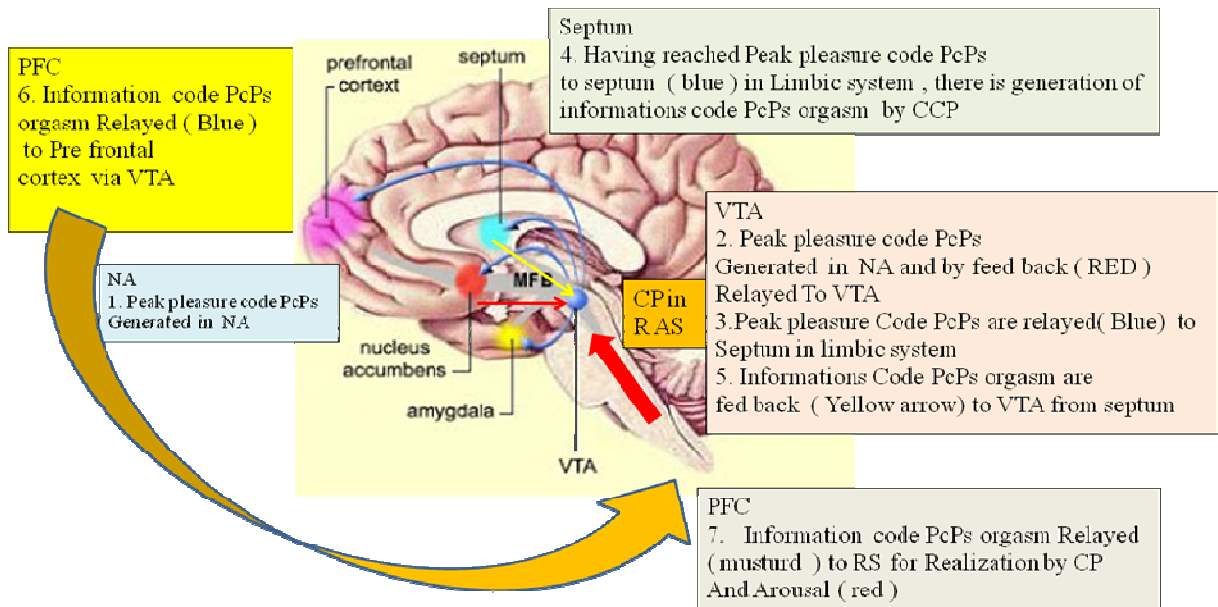

Fig – 15 – Cycle of orgasm

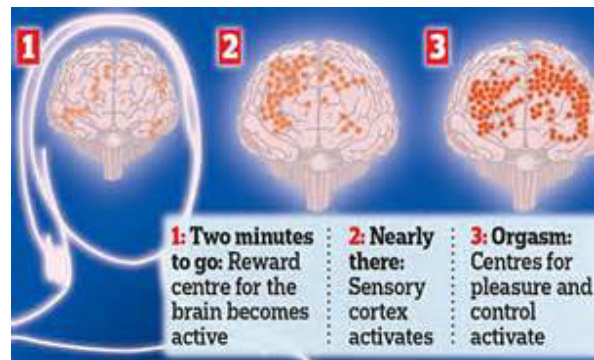

Fig 15 .1– areas involved in orgasm activation-3

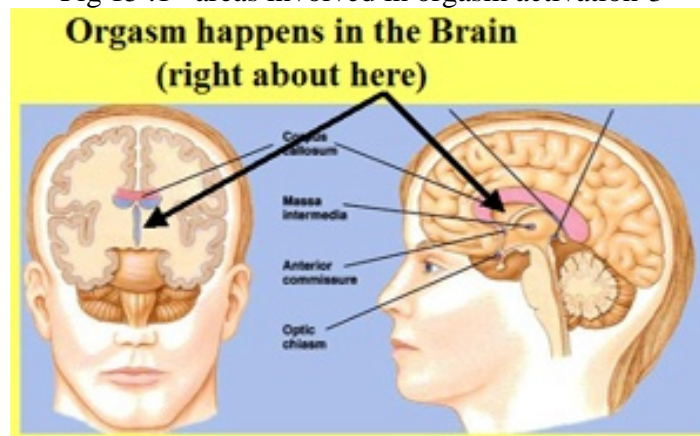

Fig 16 – Septum - Limbic system (LS) is involved in orgasm [22]
Computation and Generation of Code PcPs orgasm in septum of LS

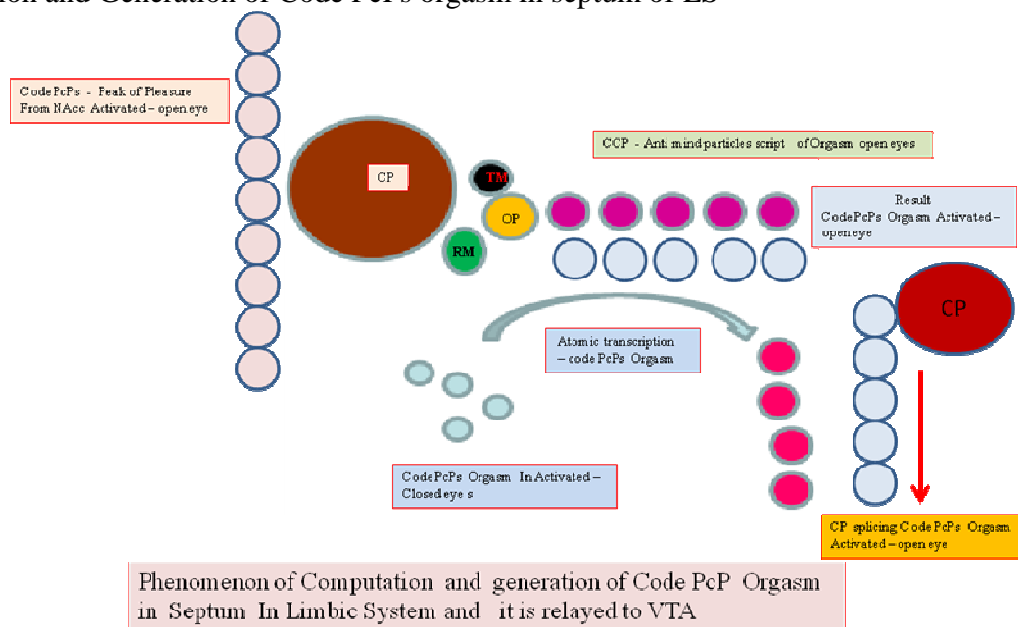

Fig 16.1- Computation and Generation of Code PcPs orgasm in LS – Septum

In atomic transcription and translation of Computation and Generation of Code PcPs orgasm, following steps take place on Yang B.B.B – B-Bit (Figure 16.1).

1. CP translates information s of Code PcPs peak of pleasure came from NAcc .
2. CP removes RM (repressor mindness-green) from OM (operating mindness -orange) thus induction of atomic transcription of orgasm is triggered.
2. OM triggers activation of free mind particles (blue -**inactivated code PCPs**) of that thought script (magenta) of “**Code PcPs orgasm**”.
3. Free mind particles (blue -**inactivated Code PcPs orgasm**) get attached to anti mind particles script (magenta one) to form messenger thought script of “**Code PcPs orgasm**”.
4. Messenger atomic genes (blue) get activated by anti mind particles thought script and further they get detached from anti mind particles thought script to form activated messenger atomic genes (activated code PCPs)

(sky blue – open eye) of “**Code PcPs orgasm**”

5. CP carries phenomenon of splicing by translating the messenger activated atomic genes (activated code PcPs) and finally there is activated message of “**Code PcPs orgasm**” is formed .

6. CP represses atomic transcription by adding RM (green) to OM (orange). Thus atomic transcription gets **halt**.

These information s (Code PcPs) are carried by photons and chemical (synapses) in brain from one center to other centers.

At the moment of orgasm, women do not have any emotional feelings.” Human brain wave patterns have shown distinct changes during orgasm, which indicate the importance of the limbic system in the orgasmic response. Male and female brains demonstrate similar changes during orgasm, with brain activity scans showing a temporary decrease in the metabolic activity of large parts of the cerebral cortex with normal or increased metabolic activity in the limbic areas of the brain. [22] (Fig 16)

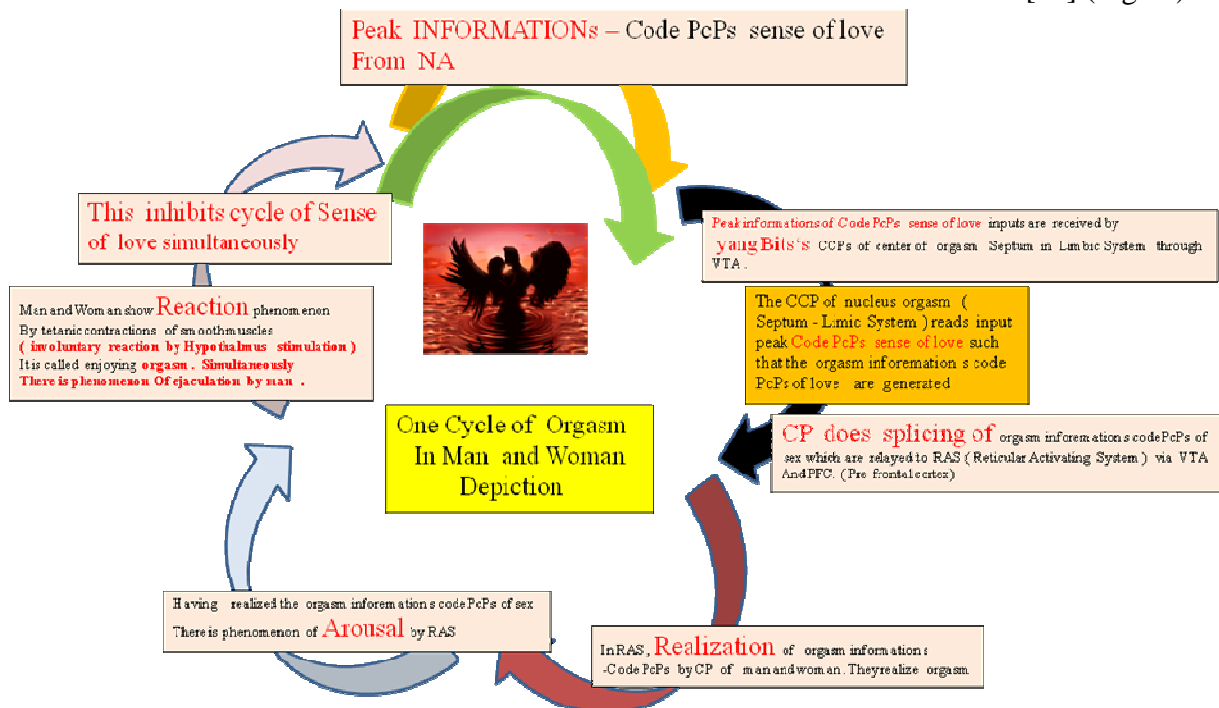

Fig 17- cycle of sense of orgasm

Conclusions – The first stage of the model is the cognitive component, where one perceives the sexual visual stimulus and judges its sexual nature and then focuses attention accordingly, which may lead to the mental rehearsal of performing a sexual act. Parts of the ventromedial prefrontal cortex (vmPFC), through connectivity to the limbic reward and emotion systems, as well as areas involved with our senses, are thought to be promoting the recognition and grading of the sex appeal of a stimulus. This subsequently alters focus of attention, thus creating the high strength of activity observed in visual processing areas of the temporal and occipital lobes. This includes the extrastriate body, which is a specialized area for perceiving the human body. As the vmPFC is well-connected to all five sensory modalities it is reasonable to assume it would similarly influence the focus and perception of the other senses; taste, smell, touch and hearing. [23]

The things you describe are far too complicated to easily derive within physics, but I do believe one day that we will be able to explain complicated phenomena such as love, for example. I just don't think anyone yet knows how to approach it. But quantum mechanics does bring all kinds of shades of grey between the binary digits.[29]

The nucleus accumbens, or NAcc, is a main factor in this process. The NAcc cannot reward or learn until the brain first releases dopamine or allowing the brain to process the stimuli received. While other parts of the pleasure center, the amygdala and the ventral medial prefrontal cortex, are responsible for harm avoidance, the NAcc is responsible for rewarding. The three parts together are called the triadic model of neurobiology, and, in unison, create what we know as motivation.. Once the reward connection has been established, the NAcc will then release dopamine and serotonin out, making one feel a sense of pride, happiness, or even euphoria. Once the body and brain have felt the desired effects from the dopamine and serotonin, it will

wish to continue to strive for the source. This is why certain drug users become addicts, as well as some gamers as our brain learns which actions activate our NAcc, it begins to create a sort of bookmark for those behaviors. Once the connection between the action and the release of dopamine and serotonin is established, our brains push for us to achieve those same goals. Now that the link has been established, our brains will continue to release dopamine and serotonin when said events are remembered. Think something as simple as winning a baseball game as a kid or even when you won your first Super Mario [27]

Love is a thought (information s, Code PcPs Love) and it is higher functions of B.B.B. It is Life. It is mediated by informations (Code PcPs – Love- lust, attraction and attachment). They are released (informations)from CCP of center (Frontal lobe (ventromedial prefrontal cortex (vmPFC),) , caudate nucleus) in brain and they reach realizing area in RAS via reward circuit (where information of code PcPs pleasure or punishment are triggered) and where our CP translates it and we say that we are having pleasure of sense of love . There are certain hormones (Bits) in synapsis also responsible for carrying different informations (Code PcPs – Lust, Attraction and Attachment apart from information s code PcPs pleasure and punishment) during love. These informations are triggered by different centers in reward circuit and cortex. It is the limbic system which is involved in orgasm and information s of orgasm (code PcPs orgasm) are relayed to RS where our CP realizes sense of orgasm . After the arousal , there is reaction in orgasm caused by stimulation of Hypothalamus causing titanic contractions of involuntary muscles causing ejaculation and physiological satisfaction and finally inhibition of sense of love cycle .
